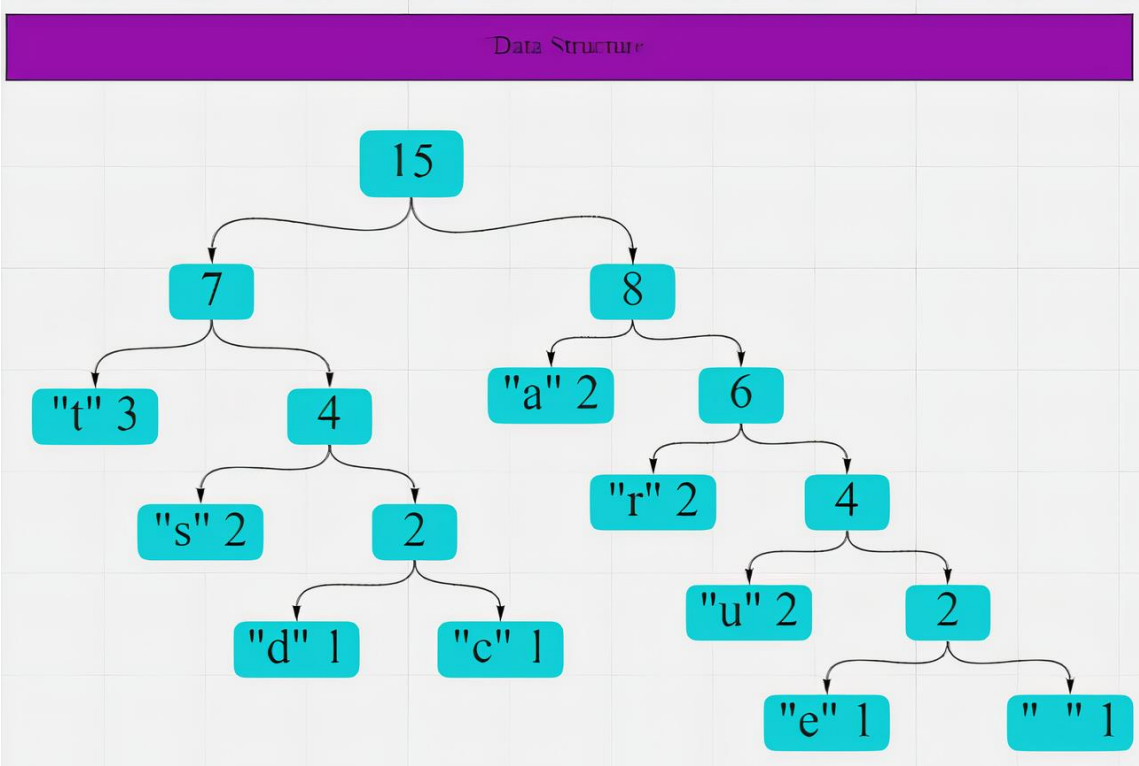
Output

Compression Algorithm Design: Huffman Coding



The binary tree is a data structure which is composed of root, branch and leaf, in which each node can have one left and one right child.

Compression Algorithm Design: Huffman Coding

Huffman Tree from the string "Data Structure"

Character	d	a	t	s	r
Frequency	1	2	3	2	2

Character	u	c	e	" "	Total
Frequency	2	1	1	1	15

Huffman coding is implemented by constructing a binary tree of nodes from a list of nodes, whose size depends on the number of symbols n. The nodes contain two fields, the symbol and the weight.

Compression Algorithm Complexity

Huffman	Time Complexity
Image compression	O(N*M)
Image decompression	O(N)

Time complexity of the Huffman algorithm. N is the width of the matrix and M represents the length of the image matrix.

Average Compression Ratio

	Compression Ratio
Healthy Cattle	2 : 1
Sick Cattle	2 : 1

Here we represent the rounded Average Compression Ratio of all the images of Healthy Cattle and Sick Cattle that were took into account in the project.

Thanks!

Supported by

Two of the authors are supported by a Sapiencia, grant funded by the municipality of Medellín. The other author is supported by Generation E, we give a big thank you to both this foundations as this development would have not been possible without their help and contribution. All authors would like to thank the Vicerrectoría de Descubrimiento y Creación, Universidad EAFIT, for their support in this research and development. This work is what it is today thanks to perseverance and constant interest.
